I coded the below in exercise.py in Udemy, not PyCharm, so I'm including my code here. This code is a Love Rating exercise.

—---

```
def calculate_love_score(name1, name2):
    names = (name1 + name2).lower()

    true_score = (
        names.count("t")
        + names.count("r")
        + names.count("u")
        + names.count("e")
    )

    love_score = (
        names.count("l")
        + names.count("o")
        + names.count("v")
        + names.count("e")
    )

    print(str(true_score) + str(love_score))

calculate_love_score("Kanye West", "Kim Kardashian")
```
